

If the key is not a string, it should be converted into a string by calling `String()` on it.

Input: keysArr = ["a", "b", "c"], valuesArr = [1, 2, 3]
Output: {"a": 1, "b": 2, "c": 3}
Explanation: The keys "a", "b", and "c" are paired with the values 1, 2, and 3 respectively.

Input: keysArr = ["1", 1, false], valuesArr = [4, 5, 6]
Output: {"1": 4, "false": 6}
Explanation: First, all the elements in keysArr are converted into strings. We can see there are two occurrences of "1". The value associated with the first occurrence of "1" is used: 4.

Input: keysArr = [], valuesArr = []
Output: {}
Explanation: There are no keys so an empty object is returned.

- `keysArr` and `valuesArr` are valid JSON arrays
- `2 <= JSON.stringify(keysArr).length, JSON.stringify(valuesArr).length <= 5 * 105`
- `keysArr.length === valuesArr.length`

Yes No
