2436. Minimum Split Into Subarrays With GCD Greater Than OneSolved🟢

Premium

Medium🔗Topics🔗Hint

You are given an array `nums` consisting of positive integers.

Split the array into **one or more** disjoint subarrays such that:

- Each element of the array belongs to **exactly one** subarray, and
- The **GCD** of the elements of each subarray is strictly greater than 1.

Return the *minimum number of subarrays that can be obtained after the split*.

Note that:

- The **GCD** of a subarray is the largest positive integer that evenly divides all the elements of the subarray.
- A **subarray** is a contiguous part of the array.

Example 1:

Input: `nums = [12,6,3,14,8]`
Output: 2
Explanation: We can split the array into the subarrays: [12,6,3] and [14,8].
– The GCD of 12, 6 and 3 is 3, which is strictly greater than 1.
– The GCD of 14 and 8 is 2, which is strictly greater than 1.
It can be shown that splitting the array into one subarray will make the GCD = 1.

Example 2:

Input: `nums = [4,12,6,14]`
Output: 1
Explanation: We can split the array into only one subarray, which is the whole array.

Constraints:

- 1 ≤ `nums.length` ≤ 2000
- 2 ≤ `nums[i]` ≤ 10⁹
